Answer: B

NEW QUESTION: 4

Your IT department is building a lightweight Front Controller servlet that invokes an application logic object with the interface:

```
public interface ApplicationController {
public String invoke(HttpServletRequest request)
}
```

The return value of this method indicates a symbolic name of the next view. From this name, the Front Controller servlet

looks up the JSP URL in a configuration table. This URL might be an absolute path or a path relative to the current request. Next, the Front

Controller servlet must send the request to this JSP to generate the view. Assume that the servlet variable request is assigned the current HttpServletRequest object and the variable context is assigned the webapp's ServletContext.

Which code snippet of the Front Controller servlet accomplishes this goal?

A. Dispatcher view

```
= request.getDispatcher(viewURL);  
view.forwardRequest(request, response);
```

B. RequestDispatcher view

```
= request.getRequestDispatcher(viewURL);  
view.forward(request, response);
```

C. Dispatcher view

```
= context.getDispatcher(viewURL);  
view.forwardRequest(request, response);
```

D. RequestDispatcher view

```
= context.getRequestDispatcher(viewURL);  
view.forward(request, response);
```

Answer: B
