NEW QUESTION: 1

A company has an Office 365 tenant that has an Enterprise E1 subscription. Users currently sign in with credentials that include the contoso.com domain suffix. The company is acquired by Fabrikam. Users must now sign in with credentials that include the fabrikam.com domain suffix. You need to ensure that all users sign in with the new domain name.

Which Windows PowerShell cmdlet should you run?

- A. Convert-MsolFederatedUser
- B. New-MsolUser
- C. Set-MsolUser
- D. Redo-MsolProvisionUser
- E. Set-MsolUserPrincipalName
- F. Set-LinkededUser
- G. Set-MsolUserLicense
- H. Set-MailUser

Answer: E

Explanation:

The Set-MsolUserPrincipalName cmdlet is used to change the User Principal Name (user ID) of a user. This cmdlet can be used to move a user between a federated and standard domain, which will result in their authentication type changing to that of the target domain.

The following command renames [\[email#160;protected\]](#) to [\[email#160;protected\]](#) Set-MsolUserPrincipalName -UserPrincipalName [\[email#160;protected\]](#) -NewUserPrincipalName [\[email#160;protected\]](#)

Incorrect: Not A: The Set-MsolUser cmdlet is used to update a user object. This cmdlet should be used for basic properties only. Not B: The Redo-MsolProvisionUser cmdlet can be used to retry the provisioning of a user object in Azure Active Directory when a previous attempt to create the user object resulted in a validation error. Not C: The Set-MsolUserLicense cmdlet can be used to adjust the licenses for a user. Not E: The Convert-MsolFederatedUser cmdlet is used to update a user in a domain that was recently converted from single sign-on (also known as identity federation) to standard authentication type. A new password must be provided for the user. Not F: Use the Set-MailUser cmdlet, used for on premises Exchange Server

(not Office 365), to modify the mail-related attributes of an existing user in Active Directory. Not G: Use the Set-LinkedUser cmdlet to modify the properties of an existing linked user account. The Outlook Live Directory Sync (OLSync) service account is a linked user. Not H: The New-MsolUser cmdlet is used to create a new user in the Microsoft Azure Active Directory (Microsoft Azure AD). In Reference: Set-MsolUserPrincipalName <https://msdn.microsoft.com/en-us/library/azure/dn194096.aspx>

NEW QUESTION: 2

Scenario: A Citrix Engineer has configured the XenMobile Public Key Infrastructure (PKI) integration with the domain-hosted Certificate Authority (CA). During enrollment the client certificate fails to be delivered to a device. The engineer reviews the logs and finds a "401 Unauthorized" error. Which two steps should the engineer take to correct this issue? (Choose two.)

- A. Enable anonymous authentication within the CA IIS server.
- B. Add the enrolled user needs to the correct Delivery Group within the XenMobile Console.
- C. Configure ClientCertificateMappingAuthentication=True within the CA IIS configuration editor.
- D. Enable XenMobile PKI service account with "Enroll" permissions on the PKI template.
- E. Add the XenMobile service account as a local user within the CA server.

Answer: C,D

NEW QUESTION: 3

- A. Option A
- B. Option B
- C. Option D
- D. Option C
- E. Option E

Answer: A
